

Pavel Botvinkin

Software Engineering Manager | Distributed Systems & Security Platforms

📍 Belgrade, Serbia ✉ pavel@botvinkin.com 🌐 @botvinkin 🌐 botvinkin.com 📧 @pavel_botvinkin

ABOUT

Engineering Manager and Technical Owner of the Yandex 360 Security Platform, responsible for technical strategy, architecture and backend engineering. Build and grow teams, coach leaders and delegate end-to-end delivery while keeping engineering priorities aligned with product goals.

PROFESSIONAL SKILLS

- People leadership: team building, coaching, performance reviews, mentoring leaders
- Technical ownership: platform strategy, product discovery, cross-team delivery
- Architecture: distributed systems, microservices
- Security: hybrid hierarchical authorization, audit logging, MDM/MAM, DLP
- Technology: Kotlin, C#, TypeScript, AI-assisted development (Codex, Cursor)

PROFESSIONAL EXPERIENCE

Yandex

Belgrade, Serbia

Backend Engineering Manager / Technical Owner — Yandex 360 Security Platform

June 2024 — Present

Yandex 360 is a productivity suite with 100M+ MAU and 170K+ organizations. Lead two cross-functional units (~20 people total), with 10 direct reports: eight backend engineers and two unit leads, each also leading a backend team. Technical remit: authorization, audit logging, MDM/MAM and DLP integration. Teams operate three production components (~10 microservices).

- Grew backend engineering from 2 to 10 people, including two team leads, conducting ~140 interviews over 18 months.
- Hired and mentored a backend engineer who became both a unit lead and a backend team lead, with delegated responsibility for delivery and day-to-day people management. He delivered a stalled cross-product group-policy project, owning architecture and implementation.
- Increased team delivery throughput by 75% through AI-assisted development, measured by the number of completed projects of comparable scope versus the previous six-month period.
- Lead preparation for semiannual performance calibrations covering ~150 backend engineers.
- Defined and secured approval for an authorization strategy covering all 10 products. Expanded adoption from one product to roughly half the suite through ROI proposals and a reference integration by the development team. Lead rollout to the remaining products.
- Initiated and led the mission-critical authorization service's stateful-to-stateless redesign and C++-to-Java rewrite through production rollout, moving state to SRE-managed PostgreSQL. Current load: ~50k read / ~500 write RPS.
- Led the inherited audit logging service's C++-to-Java rewrite to align with the team's standard stack. Current load: ~5k write / ~50 read RPS.

Technical Architect

March 2024 — June 2024

- Designed authorization roles scoped to resource IDs rather than whole organizations. Subsequently invited to lead backend engineering.

EPAM Systems

Belgrade, Serbia

Solution Architect

June 2022 — March 2024

Led architecture and technical delivery for IHS Markit's (later Accuris) technical-documentation licensing business. Guided ~6 engineers: three backend, two frontend and one QA.

- Delivered the rebuilt licensing system to production on Azure (C#, TypeScript/Angular) with NGAC-based authorization.
- Reconstructed a 25-year-old legacy system's architecture and business logic through reverse engineering and disassembly despite partially missing source code.

Atos IT Solutions and Services

Moscow, Russia

Solution Architect

November 2018 — June 2022

Led EcoMAIN's shore-side vessel-data access and analytics project for over two years in the Atos-Siemens Energy partnership, with a cross-functional team of ~10 at peak.

- Owned the Azure system's architecture, development and technical roadmap (Kotlin, TypeScript/Vue.js), coordinating with Siemens' onboard-system team. Delivered the prototype. Production rollout followed my departure.
- Brought delayed frontend delivery back on track through a code audit and escalation to Siemens. Built the shore-side management UI MVP in two weeks. The team integrated it with the existing backend.
- Delivered a MindSphere pilot lasting over a year at Transmashholding's NEVZ plant, integrating industrial machines and factory IoT systems.

ITnent

Volgograd, Russia

Software Development Team Lead

November 2015 — November 2018

Led up to five backend developers building Siemens data-analytics systems.

- Delivered Kotlin time-series analytics services and APIs to production in MindSphere.
- Owned development and release of SEPL (Signal and Event Processing Language), a low-code data-processing language. Built its Kotlin execution engine and led development of its C#/WPF desktop workflow editor.
- Developed a CERN IoT pilot using SEPL for edge processing in the Large Hadron Collider's cryogenic systems.

ADDITIONAL EXPERIENCE

Software Engineer · GLONASS-Factor

November 2012 — September 2014

Software Engineer, IT Consultant · Empire (Private Pension Fund)

July 2012 — August 2017

Lecturer, Computer Systems Dept. · Volgograd State Technical University

July 2012 — August 2017

Software Engineering Intern · PortaCapena (Belgium)

February 2010 — September 2010

Software Engineer · Part-time roles

April 2008 — February 2012

HIGHER EDUCATION

Volgograd State Technical University

Candidate of Technical Sciences (PhD equivalent) — Systems Analysis

2015

Master of Engineering and Technology — Computers, Systems and Networks

2011

Bachelor of Engineering and Technology — Computers, Systems and Networks

2009

Bachelor of Management

2009
